1) Implement the above code and paste the screen shot of the output.

CODE

```
#include <stdio.h>
int main() {
  int buffer[10], bufsize, in, out, produce, consume, choice = 0;
  out = 0;
  bufsize = 10;
  while (choice != 3) {
    printf("\n1. Produce \t 2. Consume \t3. Exit");
    printf("\nEnter your choice: ");
    scanf("%d", &choice);
    switch (choice) {
      case 1:
         if ((in + 1) % bufsize == out)
           printf("\nBuffer is Full");
         else {

  Node* temp = head;
  int item = temp->data;
  head = head->next;
  if (head == NULL) tail = NULL;
  free(temp);

3) In producer-consumer problem what difference will it make if we utilize stack for the buffer rather than an array?

Using a stack instead of a queue in the producer-consumer problem fundamentally changes the processing order from FIFO to LIFO, which may not be suitable for many traditional producer-consumer use cases.

1) Implement the above code and paste the screen shot of the output.
